A. INTRODUCTION

This report documents the results of the 2001 Highway Assessment Survey for Erie County. The intent of this study is to update the surface conditions of the county highway system. This is the first comprehensive study done of the entire Erie County highway system by the Greater Buffalo-Niagara Regional Transportation Council (GBNRTC).

Throughout the summer of 2001, the GBNRTC staff coordinated with the staff from the five Erie County districts to assess the surface pavement conditions of the entire Erie County owned highway system. In excess of 2,400 lane miles of Erie County owned highways were surveyed utilizing the visual scoring procedures developed and used by the New York State Department of Transportation in monitoring the State highway system's physical condition.

B. DESCRIPTION OF THE HIGHWAY CONDITION SCORING PROCESS

The pavement condition survey for 2001 was again based upon visual scoring procedures developed and used by the New York State Department of Transportation (NYSDOT). NYSDOT's method of rating roadways is based upon a series of visual scales (photos) showing pavement surfaces in various stages of condition.

The surface condition rating reflects the extent of scaling, cracking, patching, raveling, and faulting. The rating of these measures are made on a one to ten scale, where one represents the "poorest" roadway condition and ten the "best" roadway condition. Figure 1 details the generalized verbal descriptions for surface score conditions.

Pavement scores above six are considered a satisfactory pavement condition. A score of six (fair) denotes minor deterioration, which is expected to need attention in the near future. Surface scores of five and below indicate conditions that should be corrected immediately to prevent further deterioration and the need for complete reconstruction at a much higher cost.

There are three photographic scales used, one each for rigid (Portland Cement Concrete), overlaid (asphalt overlaid on concrete slabs), and flexible (full depth asphalt) pavement structures. When in the field, the survey teams determined the surface rating by comparing the surface condition of the highway section surveyed to the photographic scale for the appropriate pavement type. The scale point, which most closely represented the condition of the highway evaluated, is the surface rating for that particular section.

Figure 1

Generalized Verbal Descriptions of Conditioned Rating Scores for Roadway Surface Scores

General Score Condition	Condition Rating Description Surface
10 Excellent	There are no visual derivations from a smooth surface. Pavement recently constructed, reconstructed, or overlaid within the last years.
9 Excellent	Pavement should have no cracks or patches. Flexible pavement recently resurfaced within the past year or two. Overlay pavements may show evidence of some hairline reflection cracking. Rigid pavement joints function properly.
8 Good	Pavements give an excellent ride but show infrequent to occasional signs of surface deterioration. Flexible pavements begin to show very slight evidence of raveling, cracking, and wheel track wear. Rigid pavements begin to show very slight evidence of surface deterioration such as cracking, joint spalling, or scaling. Overlay pavements show evidence of very slight reflection cracking.
7 Good	Pavements give a good ride but show infrequent to occasional signs of surface deterioration. Flexible pavements show evidence of slight rutting, random cracking and some raveling. Rigid pavements show evidence of slight joint spalling, scaling, or minor cracking. Overlay pavements show evidence of slight reflection cracking and multiple cracking at reflection cracks.
6 Fair	Riding quality is noticeably inferior to new pavements, showing infrequent to occasional signs of distress. Surface defects of flexible pavements may include moderate rutting, cracking, and raveling: patching is apparent. Overlay pavements show evidence of slight to moderate cracking and raveling along cracks.
5 Poor	Riding quality is noticeably inferior to new pavements but may be tolerable for high speed traffic. Pavements show occasional to frequent signs of distress. Surface defects of pavements are the same as under the 6 rating but are more severe.
4 Poor	Pavements have deteriorated to a point where resurfacing is required, showing occasional to frequent distress. Readability, even at low speeds, is impaired. Surface defects on flexible pavements include sever rutting, cracking, raveling, and patching. Surface defects of rigid pavement include severe joint spalling, cracking, scaling and patching. Overlay pavements show evidence of severe surface delamination.
3 Poor	Pavements have deteriorated to a point where resurfacing is required immediately. Flexible pavements show evidence of severe and frequent scaling, joint spalling, faulting cracking and patching. Rigid pavements show signs of frequent and severe joint spalling, cracking and scaling.
2 Poor	Pavements are in extremely deteriorated condition and may require complete reconstruction. Motorists experience discomfort and travel speeds will decrease.
1 Poor	Pavements are in extremely deteriorated condition and are in need of immediate corrective action. There facilities are considered impassable at posted speeds.

1. 2001 Field Survey

A one or two-person survey crew conducted the actual survey of the Erie County highway system from mid July to late September 2001. The road scoring for District 1 was completed August 9, 2001. District 2 was completed on August 21, 2001. District 3 was completed first on July 11, 2001. The road scoring for District 4 was the last completed on September 13, 2001. District 5 was completed on July 23, 2001. The survey crew drove each section of county highway with the help of each district manager. Again the results of the survey are as of the dates stated above. Therefore, current road surface conditions may not reflect the score for this report, because the roads may have been reconstructed since that time.

C. 2001 SURVEY RESULTS

1. Overall Results

Approximately 2,440 lane miles of Erie County owned highways were inventoried and scored by the GBNRTC staff for the 2001 survey. Of these 2,440 county owned lane miles roughly 1,054 lane miles were federal-aid highways and about 1,387 lane miles were non federal-aid (NFA) highways. Table 1 provides the breakdown of county owned federal-aid and NFA highways by district. The condition of the Federal-aid highways in Erie County is generally better than the non Federal-aid and the overall county system. Table 2 breaks down the center line miles and lane miles by percentages for each district and by funding eligibility. There are a greater percentage of Federal-aid eligible roads in the more urbanized districts, while there is a reverse trend for the NFA roads.

Tables 3, 4, and 5 show the average surface score and vehicle miles of travel (VMT) for the entire Erie County owned highway system, the Federal-aid highway system and the Non Federal-aid highway system respectively. For the entire county system the average road score is 6.35 with a VMT of 3,305,367. The Federal-aid system had a slightly higher average road score at 6.47, with a VMT of 2,647,988. And the NFA system had an average road score of 6.24, with VMT of 657,379. As for the condition level for each category, the percentage breakdowns were about the same for each system. In the Excellent (9-10) condition level all three ranged between 11% and 12%. As for the Good (7-8) condition level each ranged between 36% and 37%. The Fair (6) and the Poor (5 or less) levels showed slightly more range at 15% to 18% and 31% to 35% respectively. Generally the Erie County highway system fell into one of two condition levels, Good and Poor. Slightly more than 2% of the county system was under construction during the road scoring.

In Table 6 the roads with the poorest road score 5 or less with traffic counts greater than 4,000 vehicles per day are listed. Therefore roads such as Dick Rd. between George Urban Blvd. And Genesee St., which has a road score of 5 and a traffic volume of 30,300, and French Rd. from Union Rd. to Towers Blvd. with a road score of 4 and a traffic volume of 18,200 could possibly be considered two of the worst roads in Erie County. Other roads with low road scores were not considered for this list due to their extremely low traffic counts.

Figure 2 illustrates the location of and surface scores for the entire Erie County Owned Highway System.

Surface Condition - County of Erie

2. District Results

The following section presents the results of each of the five Highway Department districts in Erie County. This section summarizes the individual districts by road score and also identifies some of the major highways that have Poor road scores and significant traffic volumes. The appendix provides a complete listing by district of all highway links by poorest road score and highest traffic count.

a. District 1

District 1 was scored over several days at the beginning of August 2001. Therefore the road scores are reflective of that time period. Table 7 shows the total lane mileage, condition level and the share of that condition mileage for District 1 highways in 2001. An average road score of 6.75 was calculated along with a VMT of 1,099,937. Both of which are the highest for all five districts. Over 577 lane miles were scored for this district. Of that amount almost 15% were rated Excellent, nearly 42% were rated Good, about 16% were rated Fair and 26% were rated Poor. There were slightly more than 1% of the lane miles under construction during this time.

Table A-1 of the appendix lists the summary of pavement conditions for all the county owned roads in District 1. This Table gives the highway segments, their length, Federal-aid funding category, latest traffic count and the surface score for 2001. The road segments are listed according to the lowest surface score and the greatest traffic volume.

Examples of District 1 roads that scored 5 or less (Poor) with a traffic volume of 9,500 or more includes:

- Wehrle Dr. from Transit to Harris Hill Rd.
- Hopkins Rd. from Maple Rd. to Klein Rd.
- North French Rd. from North French Rd. to Sweethome Rd.

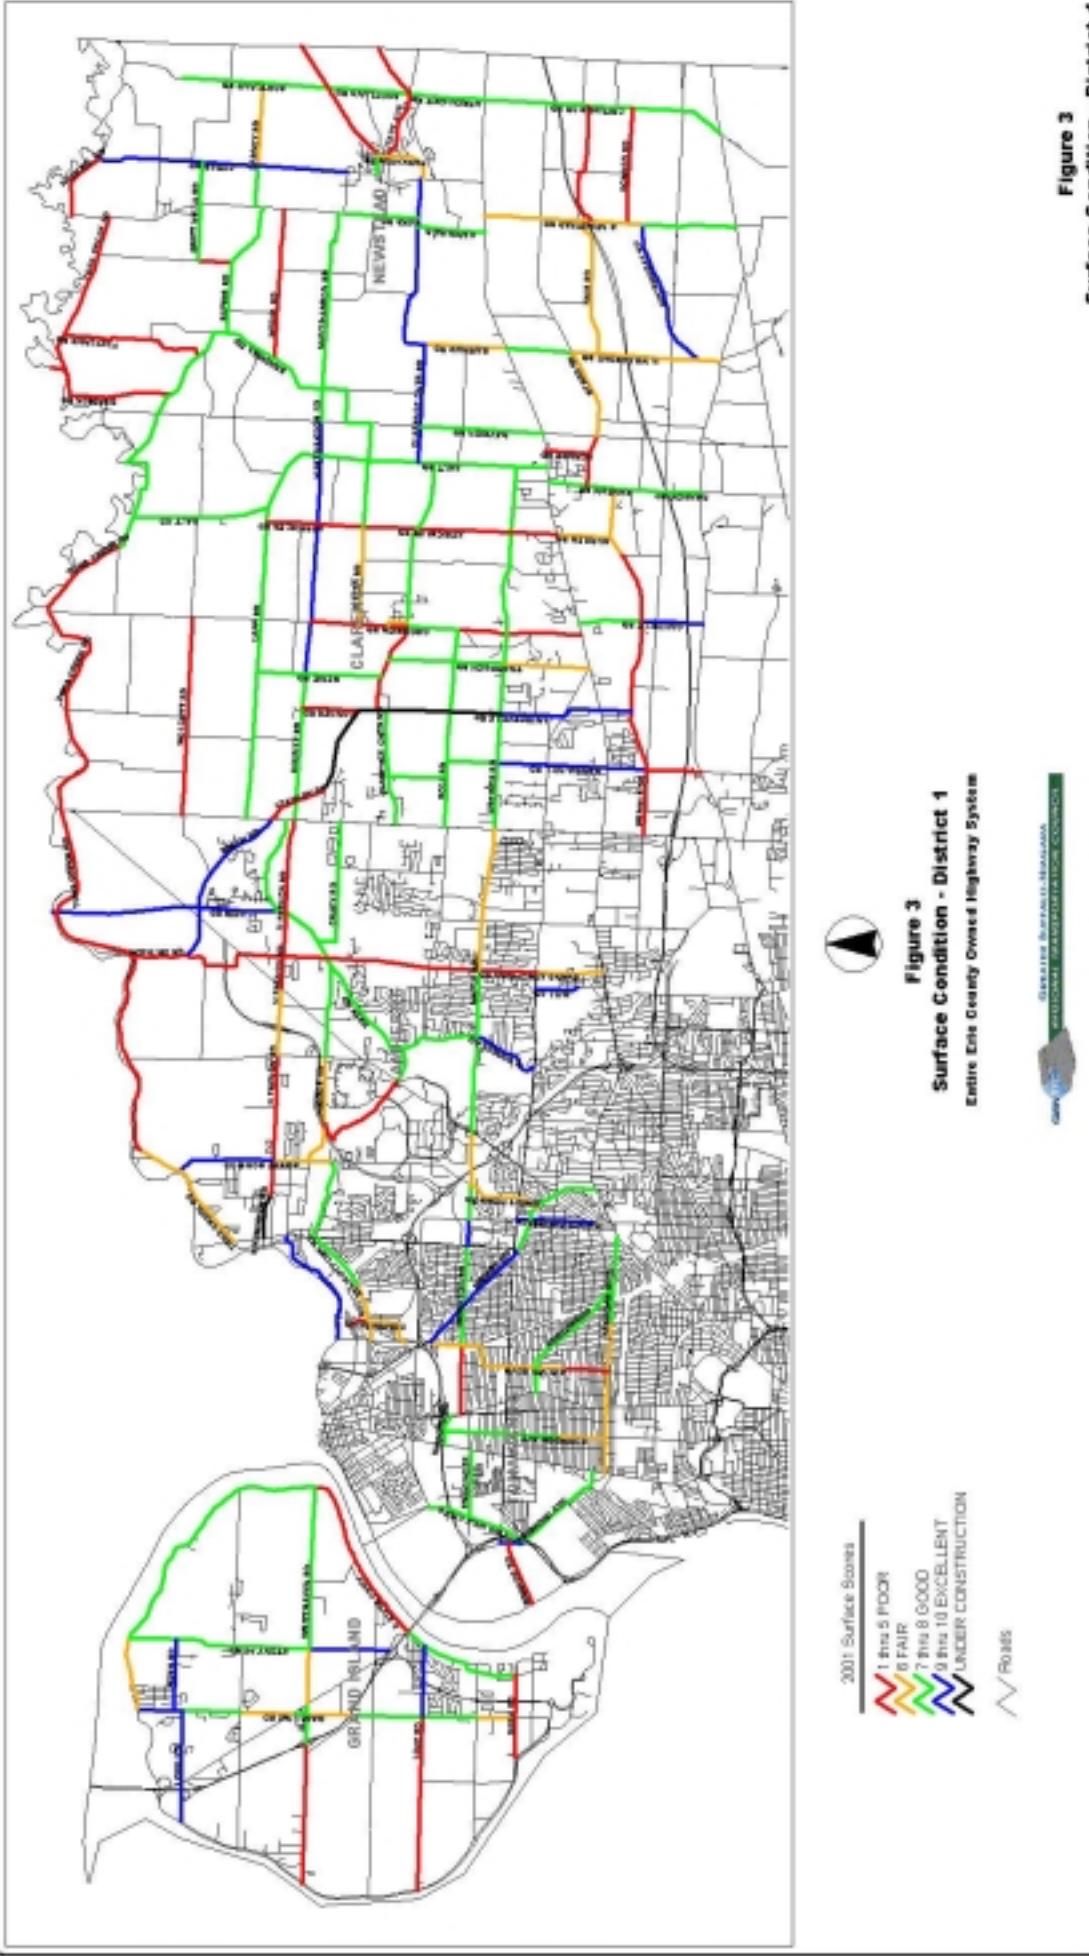

Figure 3 shows the location and surface scores of all District 1 highways.

TABLE 7

	1	0.00	0.0%	
UNDER CONSTRUCTION	UC	7.00	1.2%	1.2%
TOTAL:		577.22	100.0%	100.0%

AVERAGE ROAD SCORE: 6.75

VMT: 1,099,937

b. District 2

Road scoring for District 2 took place at the end of August 2001. Table 8 displays the results from the survey. The average road score for District 2 was 6.45 and the VMT was 1,015,999. Almost 390 lane miles were scored for District 2. Over 14% were rated Excellent, more than 27% were rated Good, almost 18% were rated Fair while nearly 37% were rated Poor. Almost 4% were under construction at this time.

In the appendix Table A-2 lists the summary of pavement conditions for all the county owned roads in District 2. The road segments are listed according to the lowest surface score and the greatest traffic volume.

Below is a listing of some of the roads that scored 5 or less (Poor) with a traffic volume of 17,000 or more:

- French Rd. from Union Rd. to Towers Blvd.
- Dick Rd. from George Urban Blvd. To Genesee St.
- George Urban Blvd. from Dick Rd. to French Rd.

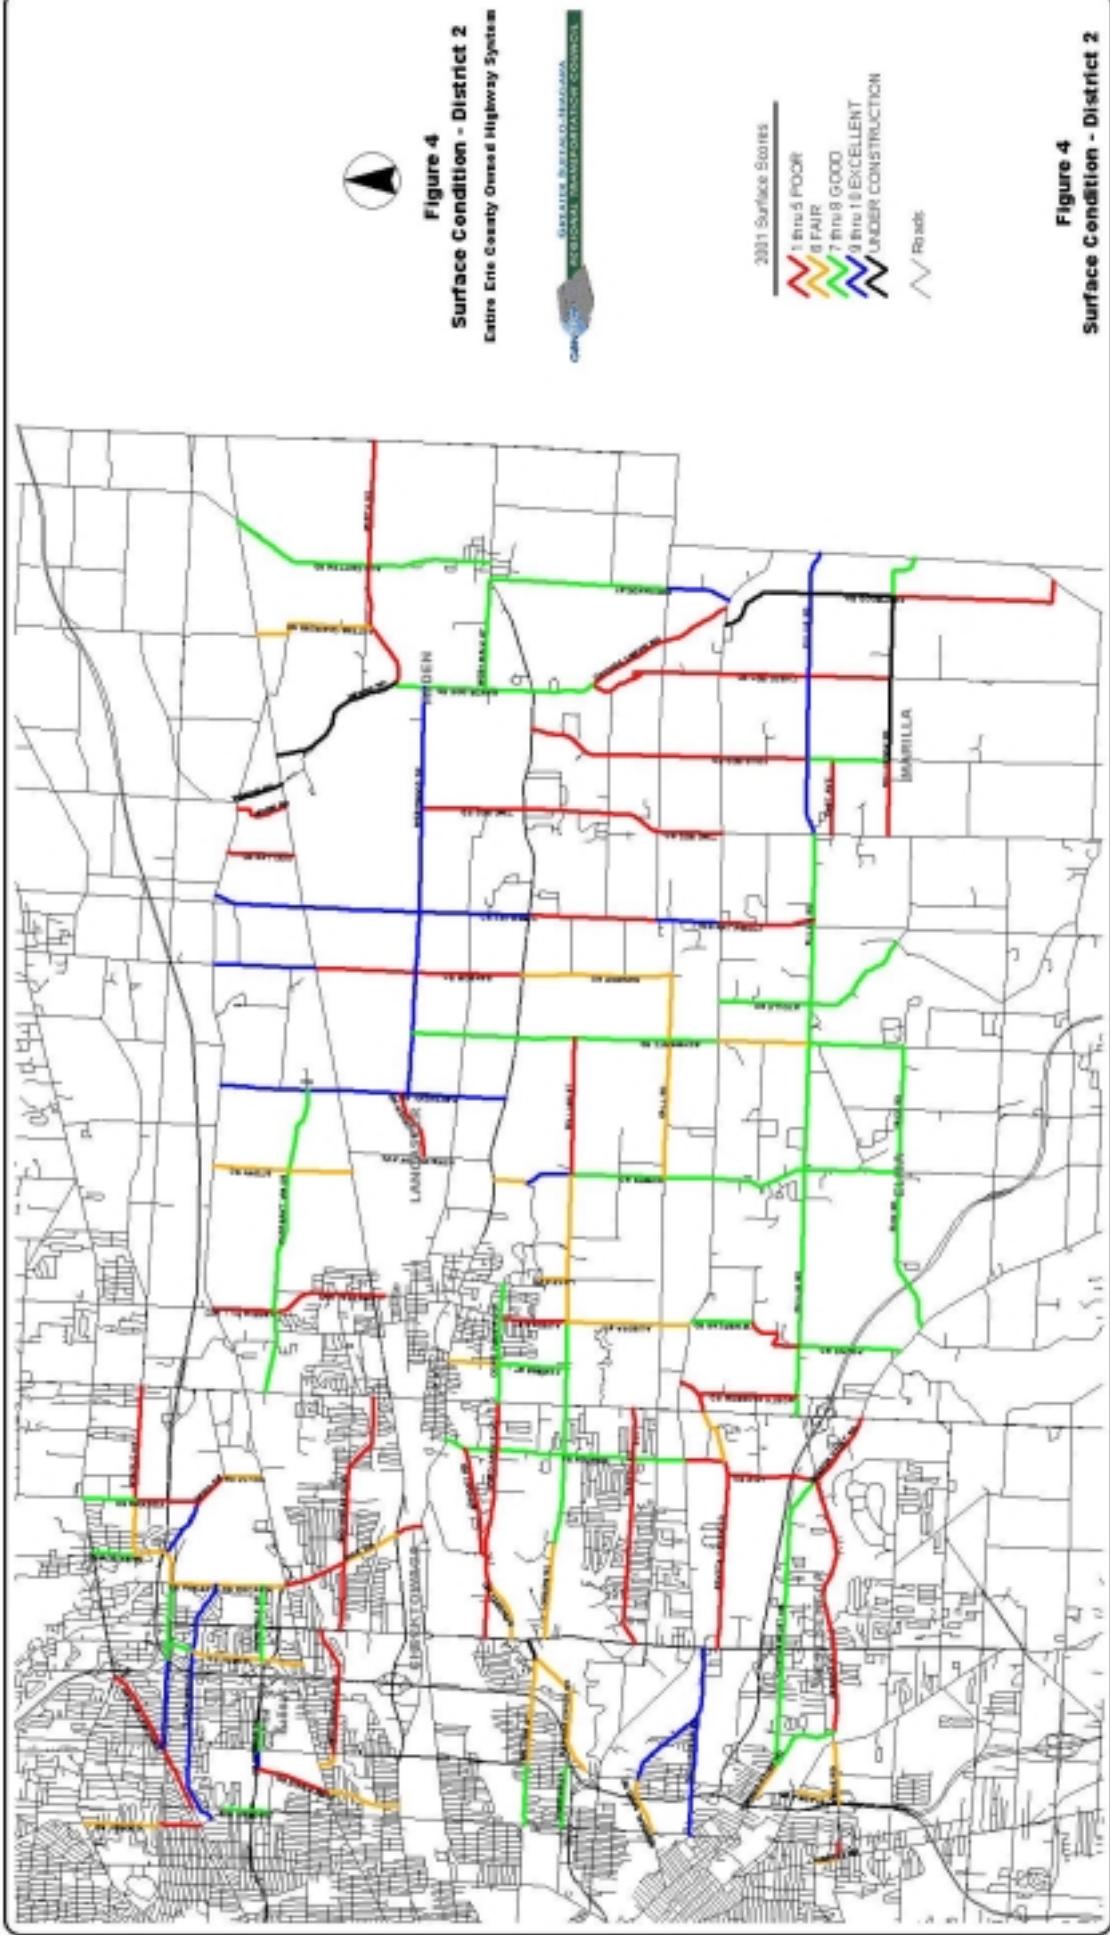

Figure 4 shows the location and surface scores of all District 2 highways.

Surface Condition - District 2
Entire Erie County General Highway System

c. District 3

District 3 was scored at the beginning of July 2001. Table 9 explains the condition levels for roadways in District 3. District 3 had an average road score of 6.18, with a VMT of 587,383. Almost 480 lane miles were scored in District 3. The percentage of roads in the Excellent category was a little more than 15%, more than 32% were rated Good, about 18% were rated Fair and more than 32% were rated Poor. Fewer than 2% of the roads were under construction at this time.

The summary of pavement conditions for county owned highways in District 3 is given in Table A-3 of the appendix. The road segments are listed according to the lowest surface score and the greatest traffic volume.

District 3 roads that scored 5 or less (Poor) with a traffic volume of 9,000 or more include:

- Legion Dr. from Camp Rd. to South Park Ave.
- Ridge Rd. from Abbott Rd. to Lackawanna City Line
- Abbott Rd. from Willet Rd. to Martin Rd.

The location and surface scores for all District 3 highways are shown in Figure 5.

d. District 4

District 4 was scored in mid-September 2001. According to Table 10 the average road score for District 4 was 6.05, the lowest of the five districts, and the VMT was 378,482. Approximately 510 lane miles was scored for this district. Only 4.5% of the lane miles were in the Excellent category. Almost 42% were rated Good, a little more than 10% were Fair and about 38% were rated Poor. Slightly over 5% of the lane miles were under construction at the time of the survey.

Table A-4 in the appendix lists the summary of pavement conditions for the county owned highways in District 4. These segments are listed according to the lowest traffic score and the highest traffic volume.

Examples of roads that scored 5 or less (Poor) with a traffic volume of 5,000 or greater for District 4 includes:

- Michael Rd. from Orchard Park Rd. to Union Rd.
- Maple St. from Aurora Town Line to West Blood Rd.
- Jewett-Holmwood Rd. from Freeman Rd. to Transit Rd.

Figure 6 gives the location and surface scores of county owned roads in District 4.

Surface Condition - District 4

e. **District 5**

District 5 was scored at the end of July 2001. The surface condition level and lane mileage are noted in Table 11. Over 486 county owned lane miles were scored for this district. The average surface score for District 5 was 6.18, with a VMT of 223,567. More than 8% of the lane miles were rated Excellent. Over 36% were rated Good while about 21% were Fair. Almost 40% of the lane miles surveyed rated Poor and none were under construction at the time of the assessment.

Table A-5 in the appendix contains the listing of road segments and their pavement conditions for the county owned highways in District 5. The segments are listed by lowest road score and the greatest traffic volume.

The following are examples of roads that scored 5 or less (Poor) and had traffic volumes greater than 2,800:

- Boston State Rd. from Town Line to Boston-Colden/Rice Rds.
- Boston State Rd. from Patchin Rd. to Zimmerman Rd.
- Allen Rd. from Genesee Rd. to Glenwood-E. Concord Rd.

The location and surface scores for District 5 highways are given in Figure 7.
